

Senseii Search

Senseii Search is a proposal for the creation of a HumInt powered platform that focuses on finding and cultivating a network of peers on the MetaNet who provide truthful information and good quality education.

Our ultimate goal is the accurate assignment and management of Intellectual Property rights to enable the equitable distribution of capital amongst billions of stakeholders, using the Bitcoin Network.

*Note for the reader: In this paper, the term 'Bitcoin' always refers to the original implementation of the Bitcoin protocol now known as 'BitcoinSV' (BSV), and **not** BTC.

Senseii LTD

Introduction:

Although Bitcoin (BSV) is 13 years old, good information about it is hard to find as competitors have an incentive to suppress it, and deep pockets with which to game Google's algorithms.

As a result, most people think BTC is Bitcoin not BSV, and students, entrepreneurs and business people are not familiar with the opportunities that Bitcoin truly offers.

Consequently, there's a lack of strong teachers in the Bitcoin space, and pitching Bitcoin to students is inefficient. They may be in the middle of a three-year education and not ready to start a business on a technology which is often misrepresented in Google searches, and profoundly misunderstood by the media.

Additionally, money raised by Bitcoin entrepreneurs is usually not raised in Bitcoin or a national CBDC, nor are shares in Bitcoin companies issued on Bitcoin by default yet.

Because of this, entrepreneurs must be trusted not to waste funds and equity cannot be atomically swapped or tracked in real-time. Many of the benefits of building on Bitcoin are lost as Bitcoin entrepreneurs get bogged down in the bureaucracy of legacy systems.

What we need is an architecture that supports Bitcoin entrepreneurs by allowing them to raise money directly in Bitcoin from sources like the Tulip Trust, in such a way that they can also benefit from tax advantages like the SEIS program offered by HMRC.

To solve this problem we propose an app that allows student entrepreneurs to capture, format, distribute and capitalise on their Intellectual Property in a methodological framework where they can prove the order of events concerning the creation or exchange of digital goods and services, including the issuing of securities, to the satisfaction of HMRC and Bitcoin investors.

Every Dojo needs a Senseii

To achieve our goals, Senseii LTD proposes an intuitive contracting platform called 'Senseii' that automatically tokenizes and indexes the Intellectual Property of the user, in return for a 1% stake in their IP token, whatever that token contains. IP Tokens may contain photos, emails, text messages, forum comments, or any digital asset that a user produces on their device.

Senseii's architecture means that Bitcoin entrepreneurs with the most valuable conglomerations of IP will rise to the top of Senseii's search index as they gather more intellectual capital from their peers in the form of likes, comments, and other tokenised IP that links value back to them.

We call this new paradigm 'Economically Weighted Search' (**EWS**) and when combined with Peer-Reviewed Validation (a.k.a. "*Social Proof*"), it has the power to replace

Google's 'PageRank' altogether and break Google down into hundreds of competing search engines.

Here's how it works: Users can tokenize *anything* they like on their device, from pictures, to videos, emails, text-messages etc at the push of a button, and Senseii hashes it, creates a token with the hash, assigns the user rights to 99% of the sale of their IP token and adds hashes of their identity into the IP Token. Senseii then copies the users IP token for fast indexing and lookup on the Senseii database and assigns 1% ownership of the revenue from the sale of the IP token to Senseii LTD.

The Senseii platform incrementally teaches entrepreneurs how to tweak their IP to raise capital, pay out salaries, dividends and royalties, deliver annuities, issue coupons and pay other forms of interest on the completion of unilateral contracts, offered by Senseii LTD. (An example of a unilateral contract might be: "Populate the topic 'Mathematics' for 10p, and contracts are paid out as verified peers review the content). *See "Pay to Correct".

Senseii's methodology will allow investors to capitalise on a vast new swathe of Bitcoin entrepreneurs in a legally compliant, auditable and private way, where balances and revenues can be tracked and shared in real-time, shares in companies traded instantly, agreements signed and board-meetings held; and where companies can be bought and sold as single NFTs with all their associated IP, revenues, staff, partnerships, records etc, intact.

Tools: Shuriken and Kitana

Senseii has developed two main tools to help entrepreneurs get the most out of Bitcoin: **Shuriken** and **Kitana**.

Shuriken automatically captures and tokenizes all users' IP for them, regardless of what apps they're using.

Kitana continuously references, indexes and updates the state of users' IP for instant lookup, retrieval and settlement of consideration.

User's IP can be referenced arbitrarily and recursively, allowing an unbounded arrangement of contractual obligations to be placed on it at any time.

Senseii provides near instant updates on the global state of contractual agreements on a user's IP, and can order and attribute payments faster and at a lower cost than any other decentralised system.

Using Senseii, a one-word answer in an SMS text-message can instantly deliver fractions of a penny to its author, plus thousands of invested stakeholders simultaneously.

Senseii also allows users to choose the level of bandwidth they are willing to share to become a node in a distributed CDN. The more IP a user creates and shares whilst using Senseii on their devices, the wealthier they become.

Senseii securely attributes a 99% stake of any users' IP to them in return for a 1% position in their IP. This 1% share token acts as an indexing token and contains a hash of the users' original IP token and hashes derived from a user's identity tokens. This 1% indexing token allows Senseii to capitalise and roll out features which further support and encourage the use of Bitcoin to build out the Senseii network.

Using this methodology, users can tokenize, monetise and scale their entire IP Portfolios online, without having to sacrifice their identity or submit their content to YouTube or Google where consumers' attention is routinely hijacked to provide advertising revenue.

As competitors wake up to Senseii's strategy, we can continuously drop our fees to near zero, until use of the MetaNet is so common-place that even a 0.1% position taken on users IP will be enough to sustain a global company big enough to dwarf Facebook & Google.

A Self-Organizing, Instantly Searchable Framework for Intellectual Property

Senseii will pioneer the creation of intuitive interfaces for smart-contracts that direct the flow of capital and revenues using natural language and machine learning according to a users' preferences. In turn, this will provide the framework for a new generation of augmented intelligence in the HumInt community, where workers are capable of evaluating the most efficient entrepreneurs and businesses with the highest projected returns.

Senseii's logic is self-organising in the sense that every token minted has an economic, time-bound and legally attributable relationship with every other token on the MetaNet. For example, users can ask commenters to pay to access their topics using natural language in a text, and Senseii will automatically handle the contractual details. Similarly, other users can accept binding contractual offers by responding with simple, one word answers. (e.g. "Yes" or "No").

Because every token minted using Senseii will have some kind of peer-reviewed economic weight attached, Senseii can index IP producers and serve IP consumers with what they want, much faster and with more accuracy and relevance than Google can..

Senseii users get paid according to how many contracts they accept and complete. Peers can query other peers easily, (e.g. Will you write a story for me for £100?) and Senseii keeps track of the state of contractual arrangements of offer and rewards. Users can get paid automatically by simply choosing what level of payments they're prepared to accept for their time.

On a forum like Reddit, even if a post gets downvoted by sybils and bots, a Senseii user still has economic weight associated with his or her pseudonymous identities, all of which can be referenced and indexed by the user, and shared privately with other users.

Users can prove their IP in a court of law, prove their value to their network, and gain rewards for their contribution to society in general if and when applicable, which is especially valuable in the context of programming and the development of IP.

Using this methodology, winning comment threads that answer digital referendums with economic outcomes can drain losing comment threads of their money and power.

Additionally, since Senseii can instantly and accurately value the economic weight on any subject, (e.g. 'Maths'), everyone can see how valuable a subject has become overall, and who the most productive and valuable peers are on that topic. In effect, every piece of information indexed by Senseii becomes 'peer reviewed', and the most useful, relevant, valuable information will rise to the top of Senseii's search results, while the sybil attacks, bots and trolls, will drop off to the bottom.

As a consequence, we expect self-organising 'Meta-Dojos' to arise where peers naturally teach each other how to leverage the architecture of the MetaNet and focus on the process of education and self-empowerment through the creation of new enterprises and business models.

Senseii's Business Model:

Every token minted through Senseii's ShurikenAPI is automatically converted into a piece of IP with 100 shares. 99 of these shares are instantly returned to the users device as a token for safe keeping, whilst one share is captured by Senseii LTD for the purposes of attribution, index and referencing.

Using this framework, Senseii allows any token to scale up into a multi-billion dollar piece of IP, no matter how small or seemingly irrelevant it may appear at first.

For example, the first tokenized 'Hello World' comment on the MetaNet may have cost just \$0.00001 to mint, but, in the Senseii framework, it could scale up and incorporate to become the 'Hello World Corporation' with billions of associated pieces of IP in metanet backlinks worth \$1bn, of which, Senseii LTD will own 1%.

Senseii gives entrepreneurs sovereign ownership of 99% of their IP, to distribute and do with as they wish in return for minting their data through the ShurikenAPI. Senseii's 1% stake in their tokenized data will further power the development of the Senseii platform, as Senseii makes its 1% whenever a user sells a token, be it for \$0.00001 or \$1bn.

Senseii Modules:

Mimoto

Mimoto constantly monitors users' devices for incoming payment requests, automatically paying valid requests and denying invalid ones. Mimoto links users securely to whatever documentation they wish to attach to prove their identity, and automatically includes hashes of their selected documents inside every token minted through the Shuriken API. Users can hash multiple different documents and attestations in Mimoto to prove distinct parts of their identity for different purposes depending on what data they need to share.

Senseii users don't need to prove their identity to anyone unless required to by law, for example in the case where they are issuing tokens for the purposes of raising capital for their enterprise and making an offer on which they could renege on in future, or in the case of a taxable capital gains event.

Senseii will always keep accurate, secure records of the IP associated with users' identities, so they can always prove exactly what they created, owned, bought or sold in the past to anyone for any reason.

This will open the door for the social integration and on-boarding of 2 billion individual new entrepreneurs who will become part of the wider peer-reviewed network of MetaNet users that screen each other for the quality of their ideas and business processes. Entrepreneurs who rise to the top of Senseii's search index automatically receive more funding from their peers as they grow.

By default, **Mimoto** authenticates users' identity when using *Onfido*, *Verisign*, *Docusign*, and other common identity services, lending these services additional weight of evidence in a court of law.

Mimoto uses a combination of Benford's methodology and HMACs to create chained, pseudonymous, discrete identities which can always be linked back to a user's identity by the user when they need to. Employing Benford's methodology allows users to keep their real identities private however, giving them the freedom to be who they want to be in public, and trade, speak and act as they wish.

Senseii Search

Senseii accounts for the economic weight backlinked to a user's IP, and searches for relevant content according to its economic weight.

If peers' IP were only searched for by cost to advertise, ads from big corporations would always rise to the top of Senseii's search index and drown out small entrepreneurs and startups, just like they do in Google searches today.

Instead, Senseii judges users according to the economic weight attached to their IP and the IP of their peers. For example, IP associated with a well-known HandCash handle, with links to many other HandCash users, will climb Senseii's ranking faster than one with payments and links to fewer.

Senseii seamlessly pays more attention to content with valuable associated IP and stronger social bonds than to bots and trolls without any economic weight (a.k.a "Skeletons").

Using this framework, users can easily query other users directly and ask to see their IP on any given topic in a secure environment, to assess if they're the right match for a job, contract, position or other designation.

Senseii Contracts Module

Similar in feel to Draw.io and Miro, **Senseii Contracts** allows for the creation of modular organizations built entirely from smart contracts.

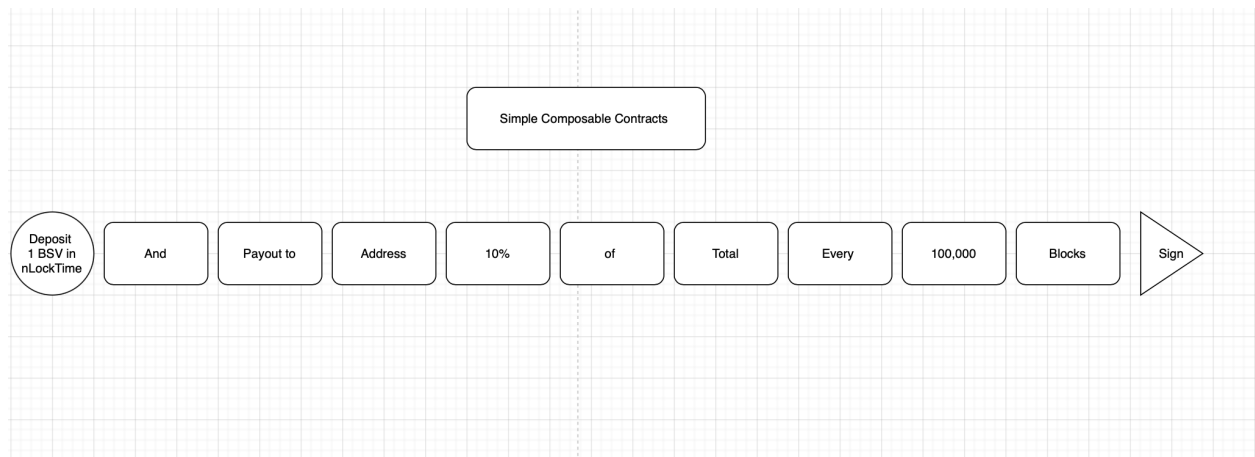

Illustration of a simple composable modular smart contract using nLockTime to pay an annuity every 100,000 blocks

Using these drag and drop modules, employees can be added to the workflow as easily as dragging and dropping their HandCash or Paymail onto the canvas. 'Smart companies' can be minted as single NFTs whose value represents all of its stock, labour, revenues, costs etc.

This allows anyone using Senseii to create efficient, streamlined organisations with absolute transparency, that in turn allows shareholders to track the flow of revenue in real time from the creation or acquisition of a product, to its salesperson and sale, to see how revenue is distributed around the organisation from the marketing department to the executive suite etc.

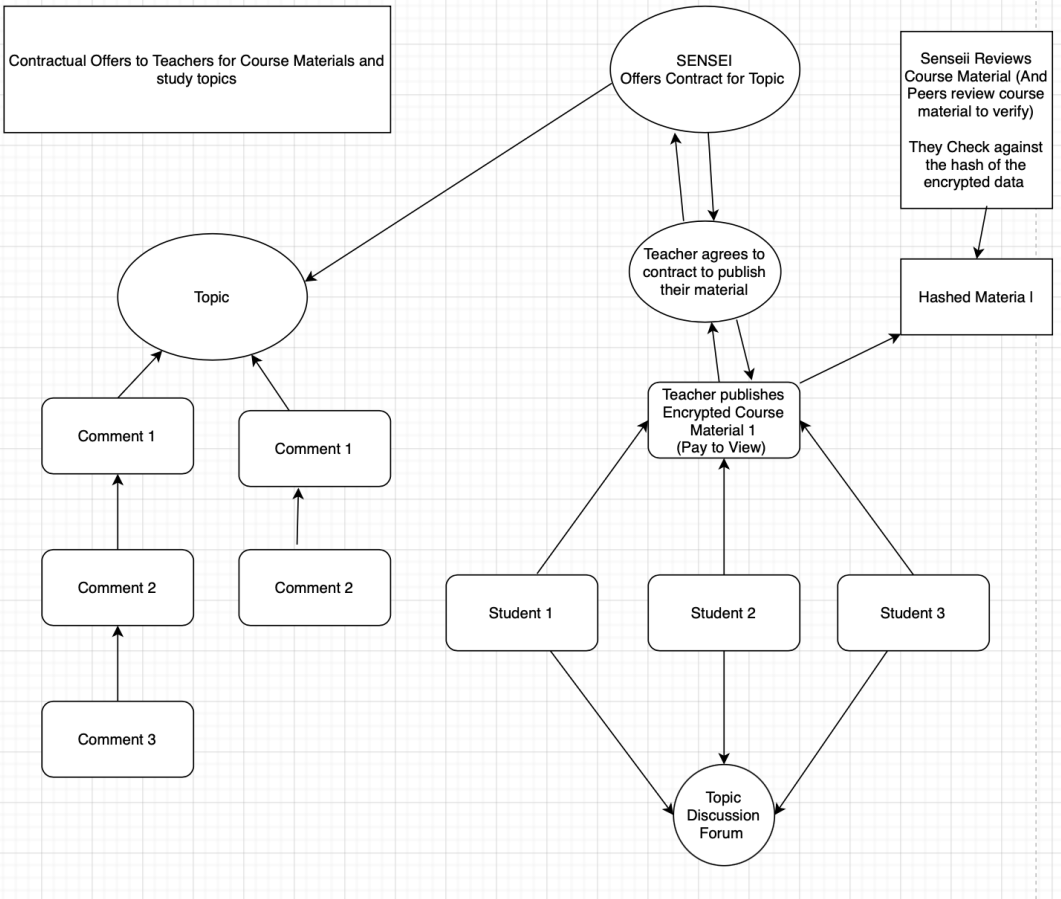

Once minted these *smart companies*' articles of association can be changed by mutual agreement of a majority of shareholders using additive key slices, in the Senseii Security module.

Additionally, the stock price of these companies can instantly be determined in Senseii Share for their accuracy, such that assessing the fitness of any given enterprise and the profitability of an investment in it, can be actively monitored and tracked in real time.

Senseii's Primary Product: Kitana

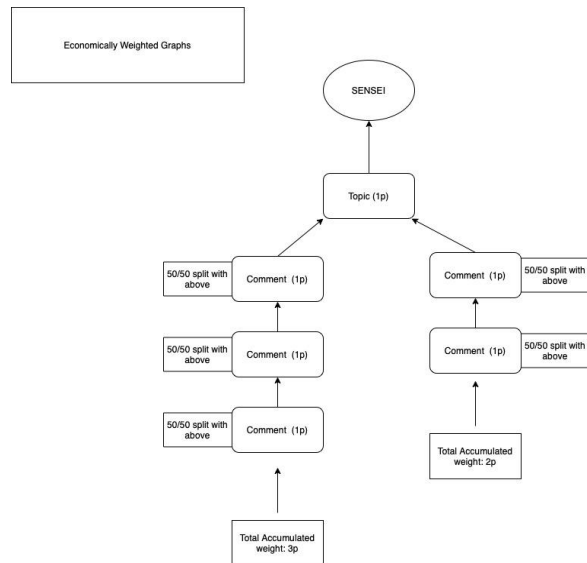

From a user's perspective, the most important part of Senseii is the intuitive teaching interface that teaches users how smart contracts work, and how to create their own, using drag and drop tokens that link to each other. Users can assign any tokenized content to any other, and arrange the contractual relationships between consumers, salespeople and shareholders, with a range of easy to use tools. Examples of tools to apply to smart contracts include 'Encrypt', 'Decrypt', 'Pay to Unlock', 'Pay to Lock', 'Rent revenue until', 'Return by', 'Forfeit if' etc. '

Drag-And-Drop smart contracts for selling educational courses

Senseii Social Graph Module:

The Senseii Social Graph is built on a recursive, economically weighted graph architecture called 'MetaGraph' where streaming payments reward the *Original Poster* (OP), or drain them, according to how many interactions they gather, and what contractual obligations have been set.

Skins built on top of the MetaGraph can look like Twitter, or Facebook, but comments have micropayments as small \$0.0001 attached, so popular tweets can grow in value as they attract attention, and can be culled (sold) by the user as and when they wish to recapture the fruits of their intellectual labour.

Additionally, the value of the Bitcoin attached to any given comment will likely fluctuate upwards the longer users refuse to sell ownership of their ideas. This is akin to 'HODLing' their intellectual capital on the MetaNet until they feel it is valuable enough to sell. Senseii LTD anticipates that this form of HODLing (and economic cultivation of a users IP *by its user*) will in time completely replace the archaic HODL mentality of the BTC culture.

Self-Organising Intellectual Capital:

The **Senseii Social Graph (or MetaGraph)** is a self-organizing, self-referential model, that actively rewards 'Proof of Work' (proof of participation) by design.

In other words, the more work a user puts into building connections in their social graph by adding content and interacting with other users, the more trusted peer reviews they accrue and the more money they make.

As a result of these interactions, we expect them to offer more contracts, which will lead to the faster incorporation of bodies of valuable knowledge around them and the creation and production of more valuable companies, with more verified IP and more potential to raise capital.

Linking Pseudonymous Identities:

Pseudonymous profiles (*nym*s) accrue value in the form of *Social Proof*, according to how reliable they are, how accurate the content they share is, and how many links to related valuable IP they have in their network.

A nym's network is its net worth.

Senseii is designed explicitly to foster a community of student entrepreneurs who can share their ideas freely, and not fear losing control of their own intellectual property. Good quality IP can be quickly and efficiently capitalised, and teachers promoted appropriately according to their knowledge and history. The emphasis is always on *learning and building*, and the proper assignment of intellectual property. Trolls are naturally excluded in the same way disruptive students are excluded from classrooms.

Senseii Wallet Module

Senseii Wallet Module teaches students how to keep track of streaming revenues and multiple balances for the different tokenized IP they own and lets them arrange simultaneous payments to an unbounded number of stakeholders.

Senseii allows students to share balances privately and publicly across organisations and groups, giving them the freedom to start liquidity pools, lending circles, credit agreements with repayment and interest payments, and annuities and bonus payouts upon the completion of contractual arrangements.

Senseii Ledger Module

An extension of the Senseii Wallet, 'Senseii Ledger' allows for the real-time tracking of balances and content in a spreadsheet format, such that inventory can be tracked and revenue accounted for in a single spreadsheet.

Senseii Store Module (The Token Library)

Senseii Store allows users to index and reference their IP according to their content type like Video, Audio or Picture, or by volume (quantity and rarity of their tokens), or by their economic weight etc. Once added to their store, a user's IP can be used in the composition of smart contracts using Kitana for quick and easy deployment.

Senseii Signature Module

A core part of ‘Mimoto’, the **Senseii Signature Module**, ensures users can securely sign their contracts by employing HMACs with combined cryptographic algorithms (e.g. Sha-1 & RIPEMD), to generate HD keys that link multiple single-use signatures back to their real identity securely, without compromising their privacy.

Mimoto allows users to prove to the tax-office or any other legal entity that requires compliance that they created, bought, rented or sold, any token for which there was a capital gains event, or other reporting need.

The terms and conditions of use (the **EULA**) of Senseii on any device explicitly states that without first linking a set of keys to a legal identity, a user cannot use Senseii to lay legal claim to the ownership of any Tokenised IP generated whilst using Senseii on their device. In other words, unless a user takes the time to register their identity on our product properly, Senseii does not guarantee users will be able to claim ownership of their IP. However: it is anticipated that for most mobile phone users, the use of Senseii on their device will implicitly link them to their government identity via their phone contract, and that in most cases, this will be accepted in a court of law as valid evidence of their identity in the case of any disputes.

Senseii Contract Market

Contract Market allows users to further tokenise and sell the contracts they have composed such that other users can buy them and incorporate them into their own businesses and business logic easily and simply. Composable contracts may even be melted down and re-constituted, provided that more than 51% of the stakeholders in any given token assent to their melting and recomposition.

Senseii Select: Choosing a Teacher

In some ways the most valuable part of the entire platform is “**Senseii Select**”, where teachers can post their profiles and link to the content and courses they’ve tokenized and offered to students.

Teachers may offer students bounties in return for the solving of problems in the courses they offer, or scholarships that assist students to learn more. They can create learning paths, and set targets and goals for their students to achieve. (for example “**Make a Brain Wallet**”) and students can use ‘Senseii Select’ to choose the teachers they prefer, the courses and modules they wish to study, and the learning path which suits them best.

A simple introductory course might include ‘**Learn how to create simple Smart Contracts using Kitana**’ whilst a more complex course might be ‘**Build compounding multiple revenue streams selling pictures of Cats**’.

Student Teacher Module

Here both teachers and students can sell their time and expertise directly to their peers via any video or audio feed including Zoom, Microsoft teams etc.

Teachers can choose the number of students they admit into any video class, as well as set the rate at which they charge, and can even charge by the second if they choose.

Senseii NFT Camera Module

A quick and easy way to introduce students to the idea of tokenizing data and capturing their own IP is through the 'Senseii Camera' module. Senseii NFT Camera allows users to convert their phone camera pictures into NFTs instantly, and publish them to the blockchain as encrypted files to which only the user has a key.

Users can then generate multiple keys to the same picture, and sell these different keys to different users to decrypt the pictures they buy. This methodology ensures that a user who buys a picture and then sells their key can always be identified. (This is useful if a buyer decides to break a contract with a seller and publishes a key that they've bought on a file-sharing network). In this way, consumers are incentivised to remain honest since their signature will match with the key they've bought.

An unlimited quantity of keys can be listed and sold using the Senseii exchange module, and revenues from sales can be streamed to multiple recipients (for example, model, studio, makeup artist, etc.).

Using the above methodology, companies like 'Ninja Punk Girls LTD' can expand massively to include thousands of content producers and millions of customers, and content for distributed CDNs can be split up amongst millions of peers, ready for delivery to consumers.

Senseii Image Exchange Module

Users can list, licence, sell and rent out their tokenized pictures using the Senseii Exchange Module, which in turn allows users to create multiple streams of revenue by selling selective access to many pictures and picture collections.

Collections can be previewed by offering one picture for free, and subsequent pictures for a price. Unique cat photos for example could be sold for as little as \$0.0001 each, and a user could build an entire multi-million dollar business by selling and licensing only cat photos.

Senseii Stream Module

Senseii Stream allows the tokenization of users' videos such that a single video can be broken down into millions of separate and individual frames and tokenized in *Senseii Store*.

These tokens can be encrypted using HMACs (as above), such that access can be sold selectively to small individual scenes in a movie or the whole movie, or indeed single frames.

This methodology also allows large files to be distributed across the network similar to Bittorrent files and re-assembled by users, who buy unique keys (as above) inside magnet links on the Senseii Exchange.

We anticipate this kind of distributed streaming methodology to replace CDNs altogether in future, as it creates a very robust data-delivery network where payment for hosting can be spread widely amongst the broadest possible network of peers, and making Denial-of-Service attacks unfeasibly costly.

Senseii Jobs

A crucial aspect of the Senseii platform is its ability to self-organise and pay for contractors to build out the most valuable parts of itself. Senseii Jobs exists to enable building out the Senseii Platform and any other business on the MetaNet.

Jobs and contracts can be posted along with nyms, recommendations and reviews, and the economic weight associated with a nym's comments, tweets, and content can all be taken into consideration.

This gives users of Senseii Jobs a useful economic reference against which to index and judge the quality and reliability of the contractors they choose to employ before they employ them.

Senseii Teams

Having posted a personal profile, users can select other member's profiles and include them in their organisations. Senseii Teams allows users to place team members in hierarchical flowcharts and add payrolls, streaming payouts, dividends and share options, and even set KPIs for their employees and add bonuses for sales targets etc.

Senseii Teams Module also allows for the incorporation of a team into a single company token, with all its contractually binding logic included, such that shares in the company can be issued and sold on the Senseii exchange or any other supported exchanges. These incorporated tokens may have a single issuer, and a single price, but can represent the interests of millions or even billions of potential stakeholders in the enterprise.

Using this architecture allows for the creation, cultivation and trade of any size organisation without disrupting the organisation's suppliers, customers, shareholders, staff etc. and without the need to rely on archaic legacy bureaucracies to rubber stamp the sale and transfer ahead of the event.

All business activities done on the Senseii platform can be proved backwards in time, provided users adhere to the Senseii app's **EULA**.

Senseii Share Module

A crucial aspect of the Senseii platform is transparency. Users can opt to share any aspect of their business with any other user for any reason using Senseii Share. For example, an entrepreneur might choose to share their company's revenues with their shareholders in real time, or their marketing department's expenses with their data-analytics department.

The advantage of Senseii Share is that any part of the business can be made transparent to any other part, or even made public, which in turn can help it to optimise, be accountable and transparent to its shareholders and the general public.

This ability to share information publicly in a secure, transparent and auditable way will lend massive amounts of confidence and value to collective enterprises.

Because of the availability of such a system, banks and institutions who rely on the approval of the electorate and the continued flow of public money will increasingly want to demonstrate that they can prove their reserves, and it will lend credence and weight to their legitimacy by demonstrating that they can be trusted.

Integration with a public global monetary system, rather than a collection of private monetary systems, will add strength and a new level of dynamism to companies who choose to build on the blockchain natively.

Additionally, **Senseii Share** will allow users to issue shares in *any part of their business, enabling them to raise additional capital to fund just those parts of the business which need it.*

Senseii Wrap

While smart-contracting can already be done with native BSV, increasingly stable-coins, other cryptocurrencies and CBDCs will need to be incorporated into user's smart contracts.

To achieve this, they will need to be locked into escrow contracts such that they can be unlocked according to the terms of the smart contracts they are in. *Senseii Wrap* allows the wrapping of these alternative digital assets so that they can be easily listed and added to Senseii Smart Contracts.

Senseii takes advantage of the fact that packets over IPv6 can *themselves* be tokenized as they cross the network. This means that packets which contain cryptocurrency tokens or digital currency (CBDC) tokens can be locked and unlocked in smart contracts on the BSV network.

Because of BSV's natural capacity to scale to accommodate all traffic over IPv4 and IPv6, Senseii can offer its users the ability to capture and contract with so-called 'Crypto Currency Networks' on all other public blockchains, and by offering this feature, Senseii can help onboard the \$1 Trillion Dollar Crypto-currency industry onto BSV, by cutting their cost of settlement down by 99%.

Senseii Legal

Allows users to upload their legally issued documents such as Tax information, incorporation documents etc. such that they can be tokenized, signed and attached securely to users smart contracts.

Senseii Legal also allows selective access to investors, lawyers, team-members etc. as required using Senseii Share.

Senseii Notes

A simple notepad that users can use to timestamp their ideas as they occur to them.

Senseii Sounds Module

Users can use the Senseii Sounds Module to automatically record and tokenize their phone calls and original audio tracks to the blockchain for inclusion in their contracts. Senseii Sounds captures and hashes the data as it flows through a user's device, and then hashes the array to a single token which can be reconstructed by the user when called on.

Senseii Security Module

In the Security Module, users learn how to create, apply and deploy HMACs, n of m multisigs, additive keys and other complex security arrangements for inclusion in their products and contracts.

(We anticipate that the Senseii Security Module might plug into nChain's proprietary 'Kensei' platform for managing corporate network security if necessary)

Senseii Lists

Senseii Lists allows entrepreneurs to track their customers, suppliers and salespeople, and acts as a neat CMS

Senseii Pitch Deck & Business Model Module

Users can upload and tokenize their pitch decks and business models before they share them with potential investors and the world in general, which in turn allows them to prove backwards in time what the substance and nature of their business idea was, thereby protecting them against breaches of their intellectual copyright by would-be poachers.

In turn this serves as a way to prove exactly what an original pitch was and allows student entrepreneurs to share their ideas freely in a way which gives them total confidence that they can always prove that their idea came first, if necessary, in a court of law.

Senseii Games Module

Here users learn to create simple contractual logic for games like Ninja Punk Girls, and even construct their own versions of the classic Ninja Punk Girls game, by adding their own artwork and characters.

Senseii's Games Module introduces users how to integrate NFT based card games with Telegram and other open-sourced instant messaging services using the Ninja Punk Girls Software Development Kit (**NPG SDK**).

Conclusion: Senseii HI

With the advent of bank-issued Digital Cash on the BSV network we expect economically weighted peer-reviewed content to proliferate on the MetaNet. Peers will be able recognise each other and *social proof* will increasingly value peer's contribution. This model is in direct competition to Google's business model which always favours their biggest advertisers.

The development of Senseii HI, the world's first trillion dollar HumInt platform, will lead to a *competition index* (a term originally suggested by Robin Kohze), where peers compete to climb to the top of their local knowledge index by peer-reviewing work that is relevant to them.

Twitter itself is one such knowledge graph ripe for redevelopment. Peers will review and climb their local knowledge index, rebuilding it as they go. Senseii HI will effectively break Twitter, Google, Reddit and Facebook down into hundreds, and then thousands of competing companies all competing to be more truthful, in order to earn more Bitcoin from their interactions. Tasks could include querying handles to see if they're bots or nyms which belong to the same peer, or reviewing Wikipedia articles.

Naturally, Senseii HI lends itself to the creation and incorporation of more and more instances of analytical business AI, that can judge entrepreneurs and enterprises according to their potential to scale.

Since analysis of this data is of great value to potential investors, the intelligence community and brain trusts alike, we expect that investors will want to fund not only the creation of the Senseii platform, but also to help fund (and micro-fund) users of Senseii software.

Every Dojo Needs a

Mimoto

Sensei Profile

Upload your avatars, create **Sign** pseudonymous identities, link them to your tokens and contracts

Sensei Search

Find tokenised data on the blockchain
Connect it to your contracts

Sensei Store

Tokenise and Encrypt your files on the Blockchain
for use in your contracts

Sensei Sign

Link your real identity to your contracts and files

Sensei Camera

Shoot pictures and publish them as **Encrypted** NFTs

Sensei Image Exchange

List, licence, rent and sell your pictures and collections

Sensei Games

Play Ninja Punk Girls

Sensei Student

Sell your time on Video & Audio feeds by the second
Teach BSV Smart Contracts

Sensei Teams

Create and organise your team. Share profiles, create hierarchies, payroll, dividends, share options etc.

Sensei Pitch Deck & Business Model

Share your pitchdeck and business model

Sensei Notes

Timestamp your ideas Progress etc.

Sensei Sounds

Record your audio and upload your Music to the Blockchain and link to your contracts

Sensei Select:

Sensei
Choose a teacher, browse courses and content, select learning paths, set targets and track your goals

Sensei Wallet

Keep track of your your balances, revenues, expenses profit and loss.
Recurring revenue streams, compounded interest etc. .

Sensei Sales

Keep track of your customers, suppliers and sales figures

Sensei Contracts

Write simple modular contracts and apply them to your BSV.

Eg: "Pay 10% of Balance every 100,000 blocks to X"

Sensei Contract Market

List and sell your Contracts to other people

Buy Contracts from others

Sensei Social

Chat, learn, comment on contracts, discuss ideas, collaborate

Sensei Stream

Tokenise Video Content

Sensei Jobs

Post contractual offers

Find contractors to execute your contracts

Sensei Wrap

Deposit Cryptocurrencies and CBDCs and wrap them on BSV in escrow contracts

Sensei Share

Issue shares in your projects, start partnerships,

Share balances and other private details of your business

Sensei Legal

Upload your legal compliance documents, allow selective access to your lawyers investors, team members etc. for signing

Sensei List

Track your suppliers and customers

Sensei Security

Use advanced features to secure your contracts using HMACs, additive keys, multi-sig etc.
